As one of the most successful applications of image analysis and understanding, face recognition has recently received significant attention, especially during the past several years. At least two reasons account for this trend: the first is the wide range of commercial and law enforcement applications, and the second is the availability of feasible technologies after 30 years of research. Even though current machine recognition systems have reached a certain level of maturity, their success is ...

Steven J. Greenwald , Marv Schaefer
Proceedings of the 2002 workshop on New security paradigms September 2002

Our thesis is that biometric and other intertwined technologies will be used to supplement the work of people in the security field. When these technologies are used, we fear that a high degree of misinterpretation and error is likely. Because of this, we need to identify the technical measures required for these systems. This

thesis, along with a justification, and proof sketch, was given to the panelists. Five areas of the technology life-cycle were investigated: modeling, implementation, inter ...

 Ari Juels , Martin Wattenberg
Proceedings of the 6th ACM conference on Computer and communications security November 1999
 We combine well-known techniques from the areas of error-correcting codes and cryptography to achieve a new type of cryptographic primitive that we refer to as a fuzzy commitment scheme. Like a conventional cryptographic commitment scheme, our fuzzy commitment scheme is both concealing and binding: it is infeasible for an attacker to learn the committed value, and also for the committer to decommit a value in more than one way. In a convent ...

 Smartcards are the most secure portable computing device today. They have been used successfully in applications involving money, and proprietary and personal data (such as banking, healthcare, insurance, etc.). As smartcards get more powerful (with 32-bit CPU and more than 1 MB of stable memory in the next versions) and become multi-application, the need for database management arises. However, smartcards have severe hardware limitations (very slow write, very little RAM, constrained stable mem ...

ACM Transactions on Information and System Security (TISSEC) November 2002
 Volume 5 Issue 4
 OASIS is a role-based access control architecture for achieving secure interoperation of services in an open, distributed environment. The aim of OASIS is to allow autonomous management domains to specify their own access control policies and to interoperate subject to service level agreements (SLAs). Services define roles and implement formally specified policy to control role activation and service use; users must present the required credentials, in an appropriate context, in order to activate ...
